

CORPORATE INTERNSHIP PROGRAM REPORT

**Submitted in partial fulfilment of the requirements of the
Post Graduate Diploma in Management**

COMPANY NAME – Prognosis Financial Private Limited

Project Title - Client Risk Profiling and Goal-Based Portfolio Design

Name - Muskan Jain

Roll No – 25PGDM208

Batch No – 2025-2027

SUBMITTED TO – Dr. Sanal Gupta

Corporate Mentor – Miss. Babita Chaudhary

FACULTY MENTOR CERTIFICATE

This is to certify that Ms. Muskan Jain, Roll No. 25PGDM208, has completed the Corporate Internship Program report titled "**Client Risk Profiling and Goal-Based Portfolio Design**" under my guidance for the fulfilment of the requirements of the PGDM program at FIIB, New Delhi.

The report is based on the student's internship work and has been prepared in line with academic expectations relating to structure, analysis, ethical responsibility, and professional presentation.

Faculty Mentor Name – Dr. Sanal Gupta

Designation – Assistant Professor

FIIB, New Delhi

Date -

ACKNOWLEDGEMENT

Acknowledgement

The successful completion of this Corporate Internship Program would not have been possible without the support and guidance of several individuals and organizations.

I would like to express my sincere gratitude to **Fortune Institute of International Business (FIIB), New Delhi**, for providing me with the opportunity to undertake this internship as a part of the PGDM curriculum. The internship has been an important learning experience that enabled me to connect classroom knowledge with practical industry exposure.

I would like to sincerely thank **Prognosis Financial Private Limited** for providing me with the opportunity to work as a Wealth Management Intern. The internship offered valuable exposure to financial planning, client profiling, investment analysis, and portfolio management. The practical learning gained during this period has significantly enhanced my understanding of the wealth management industry.

I am especially grateful to my Corporate Mentor, **Mrs. Babita Chaudhary**, for her continuous guidance, encouragement, and valuable suggestions throughout the internship. Her practical insights and professional support helped me understand various aspects of client advisory services and portfolio planning.

I would also like to extend my heartfelt thanks to my Faculty Mentor and all the faculty members of FIIB for their continuous encouragement, academic guidance, and constructive feedback throughout the Corporate Internship Program.

Finally, I would like to thank my parents, family members, and friends for their constant motivation, encouragement, and support during the successful completion of this project.

Muskan Jain

DECLARATION

Declaration

I hereby declare that this Corporate Internship Program Report entitled "**Client Risk Profiling and Goal-Based Portfolio Design**" is an original piece of work carried out by me during my internship at **Prognosis Financial Private Limited**. The report has been prepared in partial fulfilment of the requirements for the award of the Post Graduate Diploma in Management (PGDM) at the Fortune Institute of International Business (FIIB), New Delhi.

The work presented in this report is based on my own observations, learning experiences, analysis, and practical exposure gained during the internship. Wherever information has been collected from published sources, company documents, books, journals, reports, or websites, proper acknowledgment has been given through APA 7 referencing.

I further declare that this report has not been submitted, either wholly or partly, to any other university or institution for the award of any degree, diploma, or certificate.

Date: _____

Place: New Delhi

Signature

Muskan Jain

EXECUTIVE SUMMARY

Executive Summary

The Corporate Internship Program was undertaken at **Prognosis Financial Private Limited**, a financial services organization engaged in wealth management, investment advisory, and financial planning services. The internship provided practical exposure to client profiling, investment planning, portfolio construction, and financial advisory processes. It also offered an opportunity to understand how financial products are recommended based on individual client requirements, financial goals, and risk tolerance.

The project titled "**Client Risk Profiling and Goal-Based Portfolio Design**" was undertaken to understand the importance of systematic client profiling in designing suitable investment portfolios. Financial advisors must evaluate various client-specific factors, including income, financial responsibilities, investment objectives, liquidity requirements, and risk appetite before making investment recommendations. The project focused on analysing these factors and understanding how they influence portfolio construction and long-term financial planning.

A practice-based case study approach was adopted for the project. Primary information was obtained through internship observations, client discussions, training sessions, and portfolio planning exercises, while secondary information was collected from company resources, financial literature, research articles, books, and publicly available reports. The study involved analysing a sample client case and preparing a goal-based investment portfolio based on the client's financial requirements and risk profile.

During the internship, it was observed that client profiling and portfolio recommendation involve significant manual effort and require careful interpretation of financial information. As part of the Individual Contribution component, the project also explored how artificial intelligence can function as a decision-support tool by assisting financial advisors in organising client information, supporting risk assessment, and improving the efficiency of preliminary portfolio analysis. The AI component remained separate from the main project report and served only as a supporting academic initiative.

The analysis indicated that effective client profiling forms the foundation of successful financial planning. A structured understanding of client objectives, investment horizon, liquidity needs, and risk-bearing capacity enables financial advisors to recommend diversified portfolios that align with individual financial goals. The portfolio designed during the internship demonstrated the practical application of asset allocation principles, risk diversification, and goal-based investment planning.

The internship significantly enhanced my understanding of wealth management practices and strengthened my practical knowledge of financial advisory services, investment products, portfolio management, and client relationship management. It also improved my analytical thinking, communication skills, and ability to apply financial concepts in real business situations. Overall, the internship successfully bridged the gap between academic learning and professional practice while contributing to my personal and professional development.

CHAPTER 1

INTRODUCTION

The Corporate Internship Programme (CIP) forms an important part of the Post Graduate Diploma in Management (PGDM) curriculum as it provides students with practical exposure to the corporate world. It enables students to understand how theoretical concepts learned in the classroom are applied in real business situations. The internship also helps students develop analytical thinking, problem-solving abilities, communication skills, and professional ethics required in the corporate environment.

The present internship was undertaken at **Prognosis Financial Private Limited**, a financial services company engaged in wealth management and financial advisory services. During the internship, practical exposure was gained in client profiling, financial planning, portfolio construction, investment analysis, and client interaction. The internship also provided an opportunity to understand how financial advisors analyse client requirements before recommending suitable investment solutions.

The project titled "**Client Risk Profiling and Goal-Based Portfolio Design**" was undertaken to study the importance of understanding clients' financial requirements before preparing investment portfolios. The project focuses on analysing different aspects of client profiling, identifying investment goals, assessing risk tolerance, and designing suitable portfolios that align with clients' financial objectives.

1.1 Financial Services Industry Overview

The financial services industry plays a significant role in the economic development of every country. It acts as a bridge between individuals who have surplus funds and those who require capital for productive purposes. The industry facilitates savings, investments, lending, insurance, wealth creation, and financial risk management. It supports businesses, promotes economic growth, and contributes to overall financial stability.

The Indian financial services industry has experienced remarkable growth over the past two decades due to economic liberalisation, technological advancements, increasing financial awareness, and supportive government policies. Today, the industry includes commercial banks, non-banking financial companies (NBFCs), insurance companies, mutual fund houses, stock exchanges, investment advisory firms, fintech companies, and wealth management organisations.

Digital transformation has further accelerated the growth of the financial sector. Internet banking, mobile applications, online investment platforms, artificial intelligence, robo-advisory services, and digital payment systems have changed the way financial products and services are delivered to customers. These technological developments have improved accessibility, convenience, and operational efficiency while enabling organisations to provide more personalised financial solutions.

Another important factor contributing to the industry's growth is the increasing participation of retail investors. Rising disposable incomes, greater financial literacy, tax-saving opportunities, and long-term wealth creation objectives have encouraged individuals to invest in mutual

funds, equities, bonds, insurance products, and retirement planning solutions. As a result, financial advisory and wealth management services have become increasingly important in helping investors make informed financial decisions.

Despite its rapid growth, the financial services industry also faces several challenges. Market volatility, changing economic conditions, evolving customer expectations, regulatory compliance, cyber security risks, and increasing competition require organisations to continuously improve their products, services, and customer engagement strategies. Therefore, financial institutions are increasingly focusing on technology-enabled solutions and customer-centric approaches to remain competitive.

Overall, the financial services industry continues to be one of the fastest-growing sectors of the Indian economy. Its contribution extends beyond financial transactions by supporting investment, entrepreneurship, employment generation, and long-term economic development.

1.2 Wealth Management Industry in India

Wealth management refers to a comprehensive financial advisory service that helps individuals manage, grow, and protect their financial assets according to their personal financial goals and risk tolerance. Unlike traditional investment advice, wealth management integrates investment planning, tax planning, retirement planning, estate planning, insurance planning, and portfolio management into a single financial strategy.

The Indian wealth management industry has witnessed significant expansion in recent years. Increasing disposable income, rising awareness of financial planning, growth in financial markets, and a larger number of high-net-worth and affluent individuals have created substantial demand for professional wealth management services. Investors today seek expert guidance to manage their investments efficiently while balancing risk and return.

Modern investors have diverse financial goals such as children's education, retirement planning, wealth creation, purchasing property, emergency fund creation, and tax planning. These varying financial objectives require customised investment strategies instead of standard investment recommendations. Consequently, wealth management firms focus on understanding each client's financial profile before suggesting appropriate investment solutions.

A crucial component of wealth management is **client risk profiling**. Every investor has a different capacity and willingness to take financial risk. Factors such as age, income, occupation, family responsibilities, investment experience, liquidity needs, and financial objectives influence an individual's risk appetite. Accurate risk profiling enables financial advisors to recommend investment portfolios that are aligned with the client's financial goals while maintaining an appropriate level of investment risk.

Goal-based investing has also emerged as a preferred approach in modern wealth management. Rather than investing solely to maximise returns, investors now focus on achieving specific financial objectives within defined time horizons. Portfolio construction is therefore designed around individual financial goals while considering liquidity requirements, investment horizon, expected returns, and acceptable risk levels.

Technology has further transformed the wealth management industry. Artificial intelligence, machine learning, customer relationship management (CRM) systems, portfolio analytics, and digital investment platforms enable financial advisors to organise client information more efficiently and provide better decision support. However, professional judgement remains an essential component of financial advisory services, particularly when addressing complex client situations and changing market conditions.

As financial products become more diverse and investment decisions more complex, the importance of professional wealth management services continues to increase. Organisations that combine financial expertise with technology-driven solutions are better positioned to deliver personalised investment advice and build long-term relationships with their clients.

1.3 Company Background

Prognosis Financial Private Limited is a financial services organisation that provides wealth management and financial advisory solutions to individual investors. The company focuses on helping clients achieve their financial objectives through systematic financial planning, investment advisory, portfolio construction, and wealth management services.

The organisation offers guidance across various financial products, including mutual funds, insurance solutions, fixed-income investments, and other investment opportunities. Its approach emphasises understanding each client's financial circumstances, investment objectives, and risk profile before recommending suitable financial products.

The company follows a client-centric approach to financial planning by encouraging long-term investment discipline and diversified portfolio construction. Financial advisors work closely with clients to understand their financial needs, evaluate investment opportunities, and recommend strategies that balance risk and return according to individual requirements.

During the internship, the company provided exposure to various stages of the wealth management process, including client interaction, financial discussions, investment planning, portfolio design, product understanding, and client servicing. These activities helped develop a practical understanding of how financial advisory services operate in a professional environment.

The organisation also conducts regular discussions and learning sessions to familiarise interns with financial products, investment strategies, market developments, and portfolio management concepts. These sessions played an important role in enhancing practical knowledge throughout the internship period.

1.4 Internship Overview

The Corporate Internship Programme was undertaken at Prognosis Financial Private Limited in the Wealth Management and Financial Advisory division. The internship provided practical exposure to various activities associated with financial planning, client relationship management, portfolio construction, and investment advisory services.

During the initial phase of the internship, orientation and training sessions were conducted to introduce interns to the company's operations, organisational structure, financial products, and client advisory process. These sessions helped in understanding the fundamentals of wealth management, investment planning, mutual funds, insurance products, and portfolio diversification.

As the internship progressed, opportunities were provided to observe client interactions, participate in financial discussions, and understand how financial advisors collect client information before making investment recommendations. The internship involved learning about client profiling, risk assessment, goal identification, investment suitability, and portfolio allocation.

One of the key learning experiences during the internship was understanding the importance of client profiling. Every investment recommendation depends on the client's financial condition, investment objectives, liquidity requirements, and willingness to accept investment risk. This practical exposure formed the basis of the project undertaken during the internship.

The internship also provided valuable exposure to portfolio design through practical case studies, enabling the application of financial concepts learned during the PGDM programme. Overall, the internship successfully bridged the gap between classroom learning and practical financial advisory practices.

1.5 Project Background

The project titled "**Client Risk Profiling and Goal-Based Portfolio Design**" was selected to understand how financial advisors develop investment strategies based on individual client requirements. Portfolio design is not limited to selecting investment products; it begins with understanding the client's financial profile, identifying financial goals, evaluating investment constraints, and assessing risk tolerance.

During the internship, it was observed that financial advisors spend considerable time collecting and analysing client information before recommending investment options. Since every client has unique financial objectives and different levels of risk tolerance, preparing suitable portfolio recommendations requires careful analysis and professional judgement.

The project focuses on studying the practical process of client profiling and understanding how financial goals influence investment decisions. A goal-based approach was adopted to analyse how different financial objectives, such as wealth creation, retirement planning, children's education, liquidity requirements, and long-term investment planning, affect portfolio allocation.

The project also examines the importance of balancing investment risk with expected returns while maintaining adequate diversification across different asset classes. A practical portfolio case study provided by the organisation was analysed to understand how theoretical concepts of portfolio management are applied in real financial planning situations.

In addition, the internship introduced the possibility of using artificial intelligence as a decision-support tool to assist financial advisors in organising client information and improving preliminary analysis. However, the primary focus of this project remains the practical

understanding of client risk profiling and goal-based portfolio design within the wealth management process.

1.6 Problem Statement

Client profiling is one of the most important stages of the financial planning process because it forms the basis for all investment decisions. Every client has different financial objectives, income levels, family responsibilities, investment experience, liquidity requirements, and risk-bearing capacity. Therefore, recommending a suitable investment portfolio without understanding these factors may lead to inappropriate investment decisions and dissatisfaction among clients.

During the internship at Prognosis Financial Private Limited, it was observed that client profiling and portfolio planning require considerable manual effort. Financial advisors collect information through discussions, questionnaires, and financial documents before analysing the client's investment requirements. This information is then interpreted to understand the client's financial goals, risk appetite, investment horizon, and liquidity needs.

The manual nature of this process makes it time-consuming, particularly when multiple client profiles need to be evaluated simultaneously. Since financial decisions depend on accurate interpretation of client information, there is also a possibility of inconsistency in analysis if information is not organised systematically. Every client requires personalised financial planning, making the advisory process both detailed and resource-intensive.

Another challenge observed during the internship was balancing different client objectives while preparing an investment portfolio. Some clients prioritise wealth creation, whereas others focus on retirement planning, children's education, tax planning, or capital preservation. Financial advisors must carefully evaluate these objectives before deciding on an appropriate asset allocation strategy.

Therefore, the project aims to study how systematic client profiling supports goal-based portfolio design and how understanding client characteristics contributes to effective investment planning. The study also explores how structured financial analysis can improve portfolio recommendations while maintaining alignment with client objectives and risk tolerance.

1.7 Need for the Study

The financial services industry has become increasingly competitive, requiring organisations to provide personalised financial solutions that address the unique requirements of each client. Investors today have access to a wide range of investment products, making financial decision-making more complex than ever before. Consequently, financial advisors must possess a thorough understanding of client needs before recommending investment strategies.

A well-designed investment portfolio should not only aim to generate attractive returns but should also match the client's financial goals, investment horizon, liquidity requirements, and risk tolerance. If these factors are not adequately considered, clients may face financial losses, increased investment risk, or failure to achieve long-term financial objectives.

The study was considered necessary because client profiling serves as the foundation of effective wealth management. Understanding demographic characteristics, financial condition, family responsibilities, investment behaviour, and future financial requirements enables financial advisors to prepare more suitable investment plans. A structured profiling process improves the quality of financial advice and strengthens long-term client relationships.

The internship also highlighted the increasing role of technology in financial advisory services. Although investment decisions continue to rely on professional judgement, technology and AI-assisted tools can support advisors by organising financial information, improving efficiency, and assisting with preliminary analysis. Understanding these developments is important for financial professionals working in today's technology-driven financial environment.

The findings of this study are expected to contribute to a better understanding of practical wealth management processes and demonstrate the importance of client-centred financial planning in achieving successful investment outcomes.

1.8 Scope of the Study

The present study focuses on understanding the practical application of client risk profiling and goal-based portfolio design within the wealth management process at Prognosis Financial Private Limited. The scope of the project is limited to the activities observed and performed during the Corporate Internship Programme.

The study covers the process of collecting client information, understanding financial objectives, analysing investment preferences, assessing risk tolerance, and designing suitable investment portfolios. It also examines how demographic and financial factors influence portfolio allocation and investment recommendations.

A portfolio case study provided during the internship has been included to demonstrate the practical application of financial planning concepts. The case study illustrates how investment decisions are made by considering the client's financial goals, liquidity requirements, investment horizon, and risk profile.

The project primarily focuses on long-term financial planning and diversified portfolio construction. It does not attempt to evaluate the performance of individual financial products or predict future market movements. Similarly, the recommendations presented in the study are intended only for academic understanding and should not be interpreted as personalised investment advice.

Although an AI-assisted decision-support framework was explored as part of the Individual Contribution (IC) component, the detailed AI work has been submitted separately in accordance with the internship guidelines. The present report focuses exclusively on the Corporate Internship Project related to client profiling and portfolio design.

1.9 Objectives of the Study

The primary objective of this project is to understand the practical process of client risk profiling and its role in designing goal-based investment portfolios within a wealth management organisation.

The specific objectives of the study are as follows:

- To understand the client profiling process followed in wealth management services.
- To study the importance of financial goals in investment planning and portfolio construction.
- To analyse how different levels of investment risk influence portfolio allocation decisions.
- To understand the relationship between client characteristics and suitable investment strategies.
- To study the practical application of portfolio diversification and asset allocation principles.
- To analyse a real portfolio case study and understand the rationale behind investment recommendations.
- To identify challenges involved in manual client profiling and portfolio planning.
- To explore the potential role of AI-assisted decision support in improving client profiling and financial planning efficiency.
- To integrate theoretical concepts of portfolio management with practical wealth management activities observed during the internship.

1.10 Expected Outcomes

The project is expected to provide a comprehensive understanding of the practical processes involved in client profiling and portfolio design within a professional wealth management environment. It is expected to demonstrate how financial advisors evaluate client information before recommending suitable investment strategies.

The study is also expected to highlight the importance of aligning investment portfolios with client-specific financial goals, investment horizon, liquidity requirements, and risk tolerance. Through the portfolio case study, the report aims to demonstrate the practical application of financial planning concepts learned during the PGDM programme.

Another expected outcome of the study is an improved understanding of portfolio diversification and asset allocation strategies used in wealth management. The project is expected to show how different investment products are combined to create balanced portfolios that address both risk management and wealth creation objectives.

The study is further expected to provide insights into the operational challenges associated with manual client profiling and portfolio planning. These observations may contribute to

identifying opportunities for improving efficiency through structured financial analysis and technology-enabled support systems.

From a personal learning perspective, the internship is expected to strengthen knowledge of financial planning, investment advisory, client relationship management, portfolio construction, and wealth management practices. The experience gained during the internship is also expected to enhance analytical thinking, communication skills, professional confidence, and readiness for a career in the financial services industry.

CHAPTER 2

ORGANIZATION PROFILE

The Corporate Internship Programme was undertaken at **Prognosis Financial Private Limited**, a financial services company engaged in providing wealth management, financial planning, and investment advisory services. The internship provided an opportunity to understand the practical functioning of the financial advisory industry and observe how investment solutions are designed according to the financial requirements of different clients.

The organization follows a client-centric approach by focusing on understanding the financial goals, investment preferences, and risk profile of each client before recommending suitable investment products. Through systematic financial planning and portfolio management, the company aims to help clients achieve long-term financial security and wealth creation.

This chapter provides an overview of the organization, including its background, vision, mission, core values, and the principles that guide its financial advisory services.

2.1 About Prognosis Financial Private Limited

Prognosis Financial Private Limited is a financial services organization that provides wealth management and investment advisory solutions to individuals seeking professional financial guidance. The organization assists clients in planning their investments according to their financial goals, risk appetite, investment horizon, and future financial requirements.

The company primarily focuses on building long-term relationships with clients by offering personalized financial planning services rather than recommending standard investment products. Financial advisors work closely with clients to understand their financial situation and recommend suitable investment strategies that align with their objectives.

The organization offers advisory services across various financial products, including mutual funds, insurance solutions, fixed-income investments, tax-saving instruments, retirement planning solutions, and other wealth management products. The recommendations provided are based on a detailed understanding of client requirements and prevailing market conditions.

One of the distinguishing features of the organization is its emphasis on goal-based financial planning. Instead of focusing only on investment returns, advisors encourage clients to invest according to specific financial objectives such as children's education, retirement planning, wealth creation, emergency funds, home purchase, and long-term financial security.

The company also believes in maintaining transparency and ethical standards while providing financial advice. Investment recommendations are supported by financial analysis, client discussions, and systematic portfolio planning. This client-focused approach contributes to building trust and maintaining long-term professional relationships.

During the internship, exposure was gained to various aspects of financial advisory services, including client interaction, portfolio construction, product understanding, investment planning, and wealth management practices. These experiences provided valuable practical knowledge beyond classroom learning.

2.2 History

Prognosis Financial Private Limited was established with the objective of providing professional financial advisory and wealth management services to individuals seeking structured financial planning solutions. Over time, the organization has developed expertise in understanding diverse client requirements and recommending suitable investment strategies based on financial goals and risk tolerance.

With the increasing awareness of financial planning among Indian investors, the organization has continuously expanded its advisory approach by focusing on personalized investment solutions instead of product-oriented selling. This approach has enabled the company to build long-term client relationships based on trust, transparency, and professional guidance.

As financial markets have evolved, the organization has also adapted its advisory process by incorporating new investment products, digital tools, and systematic financial planning techniques. The growing complexity of investment decisions has further strengthened the importance of structured client profiling and diversified portfolio management within the organization.

Today, Prognosis Financial Private Limited continues to support clients in achieving their financial objectives through disciplined investment planning, professional advisory services, and continuous portfolio review.

2.3 Vision

The vision of Prognosis Financial Private Limited is to become a trusted and preferred financial advisory organization by helping individuals achieve long-term financial security through responsible investment planning, ethical wealth management practices, and personalized financial solutions.

The organization strives to create lasting value for its clients by promoting disciplined investing, informed financial decision-making, and continuous wealth creation. By maintaining high professional standards and client-centric services, the company aims to build long-term relationships founded on trust, transparency, and integrity.

2.4 Mission

The mission of Prognosis Financial Private Limited is to provide comprehensive financial planning and wealth management solutions that address the unique financial needs of every client.

The organization is committed to understanding client objectives, assessing financial requirements, and recommending investment strategies that are aligned with individual risk profiles and long-term financial goals. It seeks to deliver high-quality advisory services through continuous learning, market research, and professional excellence.

The company also aims to improve financial awareness among investors by encouraging informed investment decisions and promoting disciplined wealth creation practices that contribute to long-term financial well-being.

2.5 Core Values

The functioning of Prognosis Financial Private Limited is guided by several core values that shape its relationship with clients and influence the quality of financial advisory services provided.

Integrity

The organization believes in maintaining honesty, transparency, and ethical conduct while interacting with clients. Investment recommendations are made with the objective of serving the client's best interests rather than focusing solely on product promotion.

Client-Centric Approach

Every client has unique financial circumstances and investment objectives. Therefore, the organization focuses on understanding individual client requirements before recommending suitable financial solutions. Personalized financial planning forms the foundation of its advisory process.

Professional Excellence

The organization encourages continuous learning and professional development to ensure that financial advisors remain updated with changing market conditions, financial products, and regulatory developments. This enables advisors to provide informed and relevant financial guidance.

Trust and Confidentiality

Financial planning involves sensitive personal and financial information. The organization places significant importance on maintaining client confidentiality and protecting the privacy of financial information shared during advisory interactions.

Long-Term Relationship Building

Rather than focusing on short-term investment opportunities, the organization emphasizes long-term financial planning and sustainable wealth creation. Building lasting relationships

with clients through continuous support and periodic portfolio review remains one of its key priorities.

Continuous Improvement

The organization believes that financial markets, investor behaviour, and economic conditions continuously evolve. Therefore, it encourages innovation, learning, and the adoption of better financial planning practices to improve client outcomes and service quality.

2.6 Services Offered

Prognosis Financial Private Limited provides a range of financial advisory and wealth management services designed to meet the diverse financial needs of individual investors. The organisation focuses on offering customised financial solutions after understanding each client's financial objectives, investment horizon, liquidity requirements, and risk appetite. Rather than recommending a single investment product, the company follows a comprehensive financial planning approach that aims to create long-term value for its clients.

The major services offered by the organisation are discussed below.

Wealth Management

Wealth management is the core service offered by the organisation. It involves understanding a client's complete financial situation and recommending investment strategies that support long-term wealth creation. Financial advisors regularly review client portfolios and suggest modifications whenever required to ensure that investments remain aligned with changing financial goals and market conditions.

Financial Planning

Financial planning helps clients organise their finances according to their future requirements. The planning process includes identifying financial goals, estimating future financial needs, evaluating available resources, and preparing investment strategies to achieve those objectives within a specified time frame.

Investment Advisory

The organisation provides investment advisory services across different financial products based on client requirements. Advisors analyse investment opportunities and recommend suitable products after considering the client's risk profile, expected returns, and investment horizon.

Mutual Fund Advisory

Mutual funds are one of the primary investment products discussed during financial planning. The organisation assists clients in selecting appropriate mutual fund schemes based on investment objectives, asset allocation requirements, and risk tolerance. Regular portfolio reviews are also conducted to ensure that investments continue to meet client expectations.

Insurance Planning

Insurance planning forms an important part of comprehensive financial planning. The organisation helps clients understand different insurance products and select suitable protection plans based on their financial responsibilities, family needs, and long-term financial security objectives.

Retirement Planning

The organisation provides retirement planning services to help clients accumulate sufficient financial resources for post-retirement life. Advisors estimate future financial requirements and recommend investment strategies that support long-term financial independence.

Goal-Based Investment Planning

One of the most important services offered by the organisation is goal-based financial planning. Instead of focusing only on investment returns, financial advisors encourage clients to invest according to specific financial goals such as children's education, marriage planning, home purchase, retirement, or wealth creation. This approach enables more disciplined investment decisions and improves the likelihood of achieving long-term financial objectives.

2.7 Wealth Management Process

The wealth management process followed at Prognosis Financial Private Limited is systematic and client-oriented. Every investment recommendation is based on a structured understanding of the client's financial condition and future objectives.

The process generally includes the following stages:

Step 1: Client Interaction

The process begins with meeting the client and understanding their financial background. Advisors collect information related to income, occupation, family responsibilities, existing investments, liabilities, and financial expectations.

Step 2: Client Profiling

After collecting basic information, the client's financial profile is prepared. This includes analysing demographic details, financial capacity, investment behaviour, liquidity requirements, and investment experience.

Step 3: Risk Profiling

Risk profiling is one of the most important stages of financial planning. Advisors assess the client's willingness and ability to take investment risk based on age, income stability, financial commitments, and investment objectives.

Step 4: Goal Identification

The next stage involves identifying the client's financial goals. These goals may include retirement planning, children's education, wealth creation, tax planning, emergency fund creation, or purchasing a house. Clearly defined goals help determine the appropriate investment strategy.

Step 5: Portfolio Design

Based on the client's risk profile and financial objectives, a diversified investment portfolio is prepared. Asset allocation decisions are made after considering risk-return trade-offs, investment horizon, and liquidity requirements.

Step 6: Portfolio Review and Rebalancing

Financial markets and client circumstances change over time. Therefore, portfolios are reviewed periodically to evaluate investment performance and make necessary adjustments. Portfolio rebalancing helps maintain the desired asset allocation and ensures continued alignment with financial goals.

This systematic process helps financial advisors provide personalised investment recommendations while maintaining consistency in financial planning.

2.8 Organizational Structure

Prognosis Financial Private Limited follows a structured organisational hierarchy that facilitates efficient decision-making and effective client servicing. Different departments work together to provide comprehensive financial solutions and maintain high standards of customer service.

A simplified organisational structure is presented below:

Director

↓

Business Head

↓

Relationship Managers / Financial Advisors

↓

Wealth Management Team

↓

Interns

The Director is responsible for overall business strategy and organisational leadership. The Business Head supervises operational activities and coordinates with different functional teams.

Relationship Managers and Financial Advisors interact directly with clients, understand their financial requirements, and recommend suitable investment solutions. The Wealth

Management Team supports portfolio analysis, investment research, product evaluation, and client servicing.

Interns work under the guidance of experienced professionals and assist in client profiling, investment research, financial planning, portfolio preparation, documentation, and learning various wealth management practices.

This organisational structure promotes effective communication, clear responsibility allocation, and efficient client management.

2.9 Internship Department

The internship was carried out in the **Wealth Management and Financial Advisory Department**. This department plays an important role in understanding client financial requirements and recommending appropriate investment solutions.

During the internship, exposure was gained to several practical activities, including client profiling, risk assessment, financial planning, portfolio construction, product analysis, and investment discussions. Training sessions were also conducted to familiarise interns with financial products, mutual funds, insurance solutions, and portfolio management concepts.

The department provided opportunities to observe client interactions and understand how financial advisors collect client information before making investment recommendations. Portfolio case studies and practical discussions further strengthened understanding of goal-based financial planning and diversified investment strategies.

The internship experience helped bridge the gap between academic concepts and practical financial advisory services while developing analytical, communication, and problem-solving skills.

2.10 SWOT Analysis

A SWOT analysis was conducted to understand the internal strengths and weaknesses of Prognosis Financial Private Limited, along with the external opportunities and threats affecting its business environment.

Strengths	Weaknesses
Client-centric financial advisory approach	Dependence on client acquisition and relationship building
Personalised investment planning	Manual client profiling process requires significant time
Experienced financial advisors	Limited brand recognition compared to large financial institutions

Strengths	Weaknesses
Diversified financial products	Dependence on market conditions affecting investment decisions
Opportunities	Threats
Growing awareness of financial planning in India	Increasing competition from banks, fintech companies, and wealth management firms
Rising investment in mutual funds and equity markets	Market volatility affecting investor confidence
Digital transformation and AI-assisted advisory services	Frequent regulatory changes in the financial sector
Increasing demand for goal-based investing	Rapid technological changes requiring continuous adaptation

The SWOT analysis indicates that the organisation possesses strong expertise in personalised financial planning and wealth management. However, increasing competition and changing market conditions require continuous innovation, technology adoption, and customer-focused service improvements to maintain long-term growth.

CHAPTER 3

LITERATURE REVIEW

3.1 Introduction

A literature review provides the theoretical foundation for a research study by examining existing concepts, theories, and previous studies related to the selected topic. It helps in understanding how different researchers have explained a particular subject and identifies the knowledge available before conducting practical analysis.

The present project focuses on **Client Risk Profiling and Goal-Based Portfolio Design**, which combines concepts from financial planning, wealth management, investment advisory, portfolio management, and behavioural finance. Since investment decisions depend upon several financial and behavioural factors, understanding these concepts is essential for designing suitable portfolios that meet individual financial objectives.

The literature reviewed for this project covers major concepts including wealth management, financial planning, client risk profiling, risk appetite assessment, goal-based investing, portfolio diversification, Modern Portfolio Theory, asset allocation, behavioural finance, and the emerging role of Artificial Intelligence in wealth management. These concepts provide the theoretical framework for analysing client requirements and designing suitable investment portfolios during the internship.

3.2 Wealth Management

Wealth management is a comprehensive financial advisory service that assists individuals in managing, preserving, and growing their financial assets over a long period. It integrates various financial services such as investment planning, tax planning, retirement planning, estate planning, insurance planning, and portfolio management into a single financial strategy. Unlike traditional investment advisory services that primarily focus on recommending financial products, wealth management adopts a holistic approach by considering the client's complete financial situation and future objectives.

According to **Bodie, Kane, and Marcus (2021)**, wealth management involves understanding investor preferences and developing investment strategies that maximise long-term financial well-being while maintaining an acceptable level of investment risk. Financial advisors are expected to analyse the client's financial position, identify investment goals, and recommend diversified portfolios based on individual requirements.

Modern wealth management has become increasingly client-centric. Rather than offering identical investment products to every client, financial advisors now customise investment solutions according to age, income, family responsibilities, investment experience, risk tolerance, and financial objectives. This personalised approach improves client satisfaction and strengthens long-term financial relationships.

The rapid growth of financial markets, increasing disposable incomes, and greater awareness of investment opportunities have significantly expanded the wealth management industry in India. Investors today seek professional guidance not only for selecting investment products but also for achieving long-term financial security through disciplined financial planning.

Technology has also transformed wealth management practices. Digital platforms, customer relationship management systems, portfolio analytics, and AI-assisted decision-support tools enable advisors to organise client information more efficiently while improving the quality of financial advice. However, professional judgement continues to play a vital role in investment decision-making because every client presents unique financial circumstances that cannot be addressed solely through technology.

Therefore, wealth management today represents a combination of financial expertise, personalised advisory services, ethical practices, and technological support aimed at achieving sustainable wealth creation for clients.

3.3 Financial Planning

Financial planning is a systematic process of managing financial resources to achieve short-term and long-term financial goals. It involves analysing an individual's current financial position, identifying future financial requirements, estimating available resources, and developing strategies to achieve desired objectives. Effective financial planning enables individuals to utilise their income efficiently while preparing for future uncertainties and life events.

According to **Gitman, Joehnk, and Billingsley (2022)**, financial planning is a continuous process that helps individuals make informed decisions regarding savings, investments,

insurance, taxation, retirement, and estate management. Rather than focusing only on increasing wealth, financial planning emphasises balancing income, expenditure, savings, and investments according to changing financial circumstances.

The financial planning process generally begins with gathering detailed information about the client. Financial advisors analyse income sources, existing investments, liabilities, family responsibilities, insurance coverage, tax obligations, liquidity requirements, and future financial goals. This information forms the basis for preparing personalised financial plans.

One of the most important principles of financial planning is goal orientation. Every investment decision should contribute towards achieving specific financial objectives such as purchasing a house, funding children's education, retirement planning, wealth creation, or building an emergency fund. Clearly defined goals enable financial advisors to determine suitable investment horizons, expected returns, and acceptable levels of investment risk.

Risk management is another important component of financial planning. Individuals differ in their willingness and capacity to bear financial risk. Therefore, investment recommendations should always consider the client's financial stability, income consistency, family obligations, and investment experience. Appropriate insurance planning and portfolio diversification also help reduce financial uncertainty.

Financial planning is not a one-time activity. Economic conditions, market performance, personal income, family circumstances, and financial priorities continuously change over time. Consequently, financial plans require periodic review and modification to ensure that investment strategies remain aligned with the client's evolving financial needs.

During the internship at Prognosis Financial Private Limited, financial planning formed the foundation of client advisory services. Before recommending any investment product, financial advisors carefully assessed client information and designed investment strategies that balanced financial goals with risk tolerance and investment horizons. This practical exposure reinforced the importance of systematic financial planning in achieving successful wealth management outcomes.

3.4 Client Risk Profiling

Client risk profiling is one of the most important stages of the financial planning process because it enables financial advisors to understand the level of investment risk that a client is willing and able to undertake. Every investor has unique financial circumstances, personal preferences, investment experience, and financial responsibilities, making risk profiling an essential prerequisite for portfolio design.

Risk profiling involves evaluating both objective and subjective factors. Objective factors include measurable financial information such as age, income, occupation, existing assets, liabilities, investment horizon, and financial commitments. Subjective factors focus on the client's attitude towards investment risk, reactions to market fluctuations, return expectations, and investment behaviour.

According to **Reilly and Brown (2019)**, an investment portfolio should always reflect the investor's financial capacity and willingness to bear risk. Recommending aggressive

investment products to conservative investors may expose them to unnecessary financial stress, while excessively conservative portfolios may prevent long-term wealth creation for investors who can tolerate higher levels of risk.

The client profiling process generally begins with collecting demographic information, followed by an assessment of financial objectives, investment experience, liquidity needs, and risk tolerance. Based on this information, clients are commonly classified into categories such as conservative, moderate, or aggressive investors. This classification assists financial advisors in recommending suitable asset allocation strategies and investment products.

During the internship at Prognosis Financial Private Limited, client profiling was observed as the foundation of every financial advisory discussion. Advisors collected detailed client information before suggesting investment solutions, ensuring that recommendations were aligned with the client's financial goals and investment capacity. This practical exposure demonstrated that effective client profiling improves investment decision-making and strengthens long-term client relationships.

3.5 Risk Appetite Assessment

Risk appetite refers to the degree of financial risk that an investor is willing to accept while pursuing expected investment returns. It reflects both the psychological comfort of the investor and the financial ability to withstand fluctuations in investment value. Risk appetite varies significantly among individuals because financial situations, personal preferences, family responsibilities, and investment objectives differ from one investor to another.

Risk appetite assessment helps financial advisors identify the most appropriate investment strategy for each client. A comprehensive assessment considers several factors, including age, income stability, employment status, financial obligations, investment experience, investment horizon, liquidity requirements, and future financial goals. Younger investors with stable incomes and longer investment horizons may generally tolerate higher investment risk than individuals approaching retirement with fixed income requirements.

According to **Fabozzi (2020)**, understanding investor risk tolerance is essential because investment success depends not only on portfolio performance but also on the investor's ability to remain committed during periods of market volatility. Investors who are uncomfortable with risk often make emotional investment decisions, which may negatively affect long-term wealth creation.

Financial advisors frequently use structured questionnaires to assess client risk appetite. These questionnaires evaluate investment preferences, reactions to hypothetical market situations, expected returns, and financial priorities. Based on the responses, clients are categorised into different risk levels, enabling advisors to recommend appropriate investment portfolios.

Risk appetite assessment also contributes to effective portfolio diversification. Conservative investors may prefer greater allocation towards debt-oriented instruments, while moderate and aggressive investors may allocate a larger proportion of investments to equity-oriented assets for higher long-term growth potential.

The internship experience reinforced the importance of conducting systematic risk assessments before designing investment portfolios. It was observed that understanding client behaviour and financial expectations significantly improved the quality of portfolio recommendations and enhanced client confidence in financial planning decisions.

3.6 Goal-Based Investing

Goal-based investing is a financial planning approach in which investment decisions are designed to achieve specific financial objectives rather than simply maximising investment returns. Instead of focusing only on market performance, goal-based investing aligns investment strategies with individual life goals, ensuring that financial resources are allocated according to future requirements.

According to **Brinson, Hood, and Beebower (1986)**, successful investment management depends on aligning investment decisions with long-term financial objectives rather than responding to short-term market fluctuations. Modern financial planning therefore encourages investors to define clear financial goals before selecting investment products.

Common financial goals include retirement planning, children's education, marriage expenses, purchasing a home, wealth creation, emergency fund accumulation, and tax planning. Each goal has a different investment horizon, liquidity requirement, and acceptable level of investment risk. Consequently, financial advisors recommend different asset allocation strategies depending on the nature of each financial objective.

Goal-based investing also encourages investment discipline. Investors are less likely to make impulsive financial decisions when investments are linked to specific life objectives. This approach reduces emotional investing and supports long-term financial stability.

Another important advantage of goal-based investing is improved portfolio monitoring. Since every investment is linked to a predefined objective, advisors can periodically evaluate progress and modify investment strategies whenever financial circumstances or market conditions change. Portfolio rebalancing ensures that investments continue to support the client's long-term financial goals.

During the internship, goal-based investing formed an integral part of portfolio design activities. Every investment recommendation was linked to the client's financial objectives, risk profile, and investment horizon rather than focusing solely on expected returns. This practical approach demonstrated the importance of integrating financial planning principles with client-specific investment strategies.

Goal-based investing therefore represents one of the most effective approaches to wealth management because it combines disciplined investing, personalised financial planning, and long-term portfolio management to help clients achieve meaningful financial outcomes.

3.7 Portfolio Diversification

Portfolio diversification is one of the fundamental principles of investment management. It refers to the practice of spreading investments across different asset classes, industries, sectors,

and financial instruments to reduce overall investment risk. The basic principle behind diversification is that different assets respond differently to changes in market conditions. Therefore, poor performance in one investment may be offset by better performance in another, reducing the overall volatility of the portfolio.

According to **Markowitz (1952)**, diversification helps investors achieve the maximum possible return for a given level of risk by combining assets whose returns are not perfectly correlated. Rather than depending on a single investment, investors distribute their funds across multiple securities to minimise the impact of adverse market movements.

Diversification may be achieved in several ways. Financial advisors recommend diversification across asset classes such as equity, debt, hybrid instruments, gold, and other investment options. Within equity investments, diversification can further be achieved across different industries, company sizes, geographical regions, and investment styles. Similarly, debt investments may include government securities, corporate bonds, fixed deposits, and other fixed-income instruments.

The primary advantage of portfolio diversification is risk reduction. While diversification cannot eliminate market risk completely, it significantly reduces unsystematic risk associated with individual investments. Investors are therefore less exposed to losses arising from poor performance of a single security or sector.

During the internship at Prognosis Financial Private Limited, diversification was observed as an essential component of portfolio construction. Advisors recommended diversified portfolios based on the client's financial goals, investment horizon, and risk profile. Instead of concentrating investments in one product category, portfolios were designed by combining multiple investment options to achieve a balance between risk and return.

Portfolio diversification therefore remains one of the most effective strategies for achieving long-term financial stability while reducing investment uncertainty.

3.8 Modern Portfolio Theory

Modern Portfolio Theory (MPT) was developed by **Harry Markowitz (1952)** and is considered one of the most influential theories in the field of investment management. The theory provides a scientific framework for constructing investment portfolios that maximise expected returns while minimising investment risk through diversification.

According to Modern Portfolio Theory, investment decisions should not be made by evaluating individual securities independently. Instead, investors should consider how different investments interact within an overall portfolio. The combined behaviour of different assets determines the overall portfolio risk rather than the risk of each investment individually.

A key concept of Modern Portfolio Theory is the **Efficient Frontier**. The Efficient Frontier represents a set of optimal portfolios that offer the highest expected return for each level of investment risk. Investors should select portfolios lying on the Efficient Frontier because these portfolios provide the most favourable balance between risk and return.

Another important contribution of the theory is the concept of **risk-return trade-off**. Higher expected returns generally require investors to accept higher levels of investment risk.

Therefore, portfolio construction involves selecting an appropriate balance between return expectations and the investor's risk tolerance.

Although Modern Portfolio Theory provides a strong mathematical foundation for portfolio construction, it also has certain limitations. The theory assumes that investors behave rationally, markets operate efficiently, and historical data accurately predicts future performance. In reality, investor behaviour is often influenced by emotions, market uncertainty, and behavioural biases.

Despite these limitations, Modern Portfolio Theory continues to influence investment management practices worldwide. During the internship, portfolio construction was largely consistent with the principles of diversification, asset allocation, and risk-return balancing advocated by Modern Portfolio Theory. The portfolio case study prepared during the internship also reflected these principles by balancing growth-oriented investments with relatively stable investment options according to the client's financial objectives.

3.9 Asset Allocation

Asset allocation refers to the process of distributing investment funds among different asset classes to achieve an appropriate balance between investment risk and expected return. It is widely recognised as one of the most important decisions in portfolio management because it significantly influences long-term investment performance.

According to **Brinson, Hood, and Beebower (1986)**, asset allocation contributes more to portfolio performance than individual security selection or market timing. Therefore, financial advisors devote considerable attention to determining the appropriate mix of investments for each client.

The asset allocation process begins by understanding the client's financial profile. Factors such as age, income, financial responsibilities, investment horizon, liquidity requirements, and risk tolerance influence the proportion of investments allocated to different asset classes.

Generally, younger investors with longer investment horizons may allocate a larger proportion of their portfolio to equity investments because they have greater capacity to tolerate short-term market fluctuations. In contrast, conservative investors or individuals approaching retirement may allocate a larger proportion of their investments to debt instruments and fixed-income securities to preserve capital and maintain stable income.

Asset allocation is not a one-time activity. As financial markets change and clients progress towards their financial goals, portfolio allocations require periodic review and rebalancing. Portfolio rebalancing involves adjusting asset allocations to maintain the desired investment strategy while responding to changing market conditions and client requirements.

During the internship, asset allocation formed the foundation of every portfolio recommendation. Investment allocations were designed after carefully evaluating client risk profiles, investment objectives, and liquidity needs. This practical experience reinforced the importance of disciplined asset allocation in successful wealth management.

3.10 Behavioural Finance

Behavioural finance is a branch of finance that studies how psychological factors influence investment decisions. Traditional financial theories assume that investors make rational decisions based solely on available information and expected returns. However, behavioural finance recognises that emotions, cognitive biases, and personal experiences frequently affect investment behaviour.

According to **Kahneman and Tversky (1979)**, individuals often make financial decisions that deviate from rational behaviour because they are influenced by emotions such as fear, greed, overconfidence, regret, and loss aversion. These behavioural biases can lead investors to make poor investment decisions, particularly during periods of market volatility.

Some common behavioural biases include:

Overconfidence Bias

Investors may overestimate their knowledge and ability to predict market movements, leading to excessive trading and increased investment risk.

Loss Aversion

Investors generally experience greater emotional discomfort from financial losses than satisfaction from equivalent gains. As a result, they may avoid selling loss-making investments even when doing so would be financially beneficial.

Herd Behaviour

Investors sometimes imitate the investment decisions of others without conducting independent analysis. This behaviour often contributes to speculative market bubbles and irrational investment decisions.

Anchoring Bias

Investors may rely excessively on initial information or historical prices while making investment decisions, even when new information becomes available.

Confirmation Bias

Investors tend to seek information that supports their existing beliefs while ignoring contradictory evidence, resulting in biased investment decisions.

Behavioural finance has become increasingly important in wealth management because understanding investor psychology enables financial advisors to provide more effective guidance. Advisors not only recommend investment products but also help clients maintain disciplined investment behaviour during periods of market uncertainty.

During the internship, it was observed that client behaviour often influenced investment decisions. Financial advisors devoted considerable effort to educating clients about long-term investing, diversification, and the importance of avoiding emotional reactions to short-term market fluctuations. This practical exposure demonstrated that successful wealth management requires both technical financial knowledge and an understanding of human behaviour.

Behavioural finance therefore complements traditional investment theories by recognising that investor psychology plays an important role in financial decision-making and portfolio management.

CHAPTER 4

RESEARCH METHODOLOGY

4.1 Introduction

Research methodology refers to the systematic process adopted to achieve the objectives of a study. It explains the research design, data collection methods, analytical approach, sources of information, and procedures followed during the project. A well-defined research methodology enhances the reliability and validity of the findings by ensuring that the study is conducted in a structured and logical manner.

The present project, "**Client Risk Profiling and Goal-Based Portfolio Design**," was carried out during the Corporate Internship Programme at Prognosis Financial Private Limited. Since the project was based on practical exposure gained during the internship rather than purely academic research, a **practice-based case study approach** was adopted. The methodology focuses on understanding the actual client profiling and portfolio design process followed within the organisation and applying financial planning concepts to a real portfolio case study.

The methodology also incorporates observations made during training sessions, client interactions, portfolio discussions, and practical learning experiences gained throughout the internship.

4.2 Research Design

The research design adopted for this study is a **Practice-Based Case Study Design**. This approach was selected because the project is based on practical exposure and organisational learning rather than hypothesis testing or large-scale survey research.

A practice-based case study allows the researcher to analyse real business situations, understand organisational processes, and apply academic concepts to practical decision-making. In the present project, the focus was on understanding how financial advisors perform client profiling, assess investment risk, identify financial goals, and design suitable investment portfolios.

The project involved analysing the wealth management process followed by Prognosis Financial Private Limited and applying the observed practices to a portfolio design exercise based on a client case. This approach enabled a deeper understanding of financial planning practices while maintaining close alignment with the internship objectives.

Unlike descriptive surveys or experimental research, the practice-based case study emphasises practical learning, observation, and professional application. Therefore, it was considered the most appropriate research design for the present study.

4.3 Practice-Based Case Study

The selected route for this project is a **practice-based case study** because the study is based on real organisational exposure and practical financial planning activities observed during the internship.

The project focuses on analysing the client profiling process, understanding investment behaviour, assessing financial goals, evaluating investment risk, and preparing suitable portfolio recommendations. These activities were carried out by observing organisational practices rather than conducting independent surveys or collecting large-scale quantitative data.

A portfolio case provided during the internship formed the practical foundation of the study. The case involved analysing a client with specific financial goals, investment requirements, liquidity needs, and risk profile. Based on these details, a diversified investment portfolio was designed by applying portfolio management principles and financial planning concepts learned during the PGDM programme.

The practice-based approach enabled the integration of theoretical knowledge with practical organisational learning. It also provided opportunities to understand the challenges faced by financial advisors while preparing personalised investment recommendations for clients with different financial objectives.

This research design therefore supports experiential learning by allowing students to analyse actual workplace situations and develop practical solutions using management concepts.

4.4 Data Collection

The quality of any research depends upon the accuracy and relevance of the information collected. For the present study, both **primary** and **secondary** sources of information were utilised to understand the client profiling process and portfolio design activities.

The data collection process was carried out throughout the internship period while participating in organisational activities, attending training sessions, observing client discussions, and analysing financial planning practices.

Primary information provided practical insights into the day-to-day functioning of wealth management activities, whereas secondary information supported the theoretical understanding of financial planning, portfolio management, and investment advisory concepts.

The combination of primary and secondary data improved the comprehensiveness of the study and enabled comparison between academic concepts and practical organisational practices.

4.5 Primary Data

Primary data refers to information collected directly from original sources for the specific purpose of the study. In the present project, primary information was obtained through practical exposure gained during the internship at Prognosis Financial Private Limited.

The primary sources of information included:

Observation

A significant portion of the learning was obtained by observing financial advisors during client interactions, portfolio discussions, and financial planning activities. Observation helped in understanding how advisors collect client information, assess financial requirements, and recommend suitable investment strategies.

Client Discussions

Although confidential financial information was not accessible, exposure to client discussions provided an understanding of how financial goals, investment preferences, liquidity requirements, and risk tolerance influence investment decisions.

Training Sessions

The organisation conducted several training sessions covering mutual funds, financial planning, wealth management, portfolio construction, and investment advisory. These sessions contributed significantly to the practical understanding of financial products and portfolio management principles.

Portfolio Design Exercise

A practical portfolio case study assigned during the internship served as one of the primary sources of information. The exercise involved analysing client requirements and preparing a diversified investment portfolio based on financial planning principles.

Internship Learning Notes

Personal notes prepared during training sessions and daily internship activities also served as an important source of primary information. These notes documented key concepts, practical observations, and learning experiences throughout the internship.

4.6 Secondary Data

Secondary data refers to information collected from previously published sources. It was used to develop the theoretical foundation of the study and support the analysis carried out during the internship.

The secondary sources utilised in the project included:

- Financial planning textbooks
- Portfolio management books
- Research journals

- Academic articles
- Company training materials
- Mutual fund information documents
- Financial newspapers and magazines
- RBI publications
- SEBI guidelines
- AMFI publications
- Official websites of financial institutions

Secondary information was particularly useful in understanding concepts such as portfolio diversification, asset allocation, behavioural finance, client risk profiling, and wealth management practices.

The combination of primary observations and secondary literature enabled a comprehensive understanding of both theoretical concepts and practical financial advisory activities.

4.7 Research Framework

The research framework provides a structured sequence of activities followed during the execution of the project. It explains how the study progressed from identifying the problem to developing practical findings and recommendations.

The framework adopted for this study is presented below:

Identification of Internship Project

↓

Understanding Organizational Processes

↓

Review of Financial Planning and Wealth Management Concepts

↓

Observation of Client Profiling Activities

↓

Collection of Primary and Secondary Data

↓

Analysis of Client Case Study

Goal-Based Portfolio Design

Interpretation of Findings

Recommendations and Conclusion

The framework illustrates the systematic approach followed throughout the internship. Initially, the organisational environment and financial advisory process were studied. This was followed by collecting information through observations, training sessions, portfolio discussions, and secondary literature. The collected information was then analysed to understand the practical application of client risk profiling and goal-based portfolio design.

The framework ensured that each stage of the study contributed logically towards achieving the research objectives while maintaining consistency between theoretical concepts and practical observations.

4.8 Methodology

The methodology adopted for this project was primarily qualitative in nature because the study focused on understanding organisational practices rather than performing statistical analysis. The emphasis was placed on practical learning, observation, case analysis, and application of financial planning concepts within the organisational environment.

The methodology involved several stages. During the initial phase of the internship, organisational training sessions were attended to understand the company's financial products, wealth management process, and investment advisory practices. These sessions provided the conceptual foundation required for understanding the practical aspects of financial planning.

Subsequently, exposure to client interactions and portfolio discussions helped in understanding how financial advisors collect client information, assess investment requirements, identify financial goals, and evaluate risk tolerance. Continuous observation of these activities provided valuable insights into the practical functioning of wealth management services.

A portfolio design case study assigned during the internship served as the central component of the project. The case involved analysing the client's demographic profile, financial objectives, investment horizon, liquidity requirements, and risk profile before recommending an appropriate portfolio allocation. Financial planning concepts such as diversification, asset allocation, and risk-return balancing were applied while designing the portfolio.

The methodology also included reviewing academic literature related to wealth management, financial planning, portfolio management, behavioural finance, and investment analysis. This

helped in comparing theoretical concepts with actual organisational practices observed during the internship.

Overall, the adopted methodology provided a balanced combination of theoretical understanding and practical application, making it suitable for achieving the objectives of the study.

4.9 Data Analysis Approach

The collected information was analysed using a qualitative and analytical approach. Rather than applying statistical tools or quantitative models, the analysis focused on interpreting practical observations and understanding organisational processes.

The analysis involved comparing the financial planning practices observed during the internship with established concepts from wealth management and portfolio management literature. Client profiling activities were examined to understand how demographic factors, financial goals, risk tolerance, and investment preferences influence portfolio construction.

The portfolio case study was analysed by evaluating the client's financial profile, investment objectives, liquidity requirements, and risk appetite. Based on these factors, suitable asset allocation decisions were made using the principles of diversification and long-term investment planning.

The analysis also considered the relationship between financial planning concepts and practical decision-making. Observations obtained during client discussions, training sessions, and portfolio reviews were compared with theoretical frameworks discussed in academic literature.

The findings were interpreted in the context of practical wealth management rather than statistical significance. This analytical approach helped develop meaningful conclusions regarding the importance of systematic client profiling and goal-based investment planning.

4.10 Limitations of the Study

Every research study has certain limitations that may influence the scope and applicability of its findings. The present study is also subject to a few limitations, primarily because it was conducted within the duration of the Corporate Internship Programme.

The major limitations of the study are as follows:

- The study is based on observations made during the internship period and is therefore limited to the organisational practices experienced during that time.
- Access to detailed client financial information was restricted because of confidentiality and privacy policies followed by the organisation.
- The project focuses on a limited number of practical case studies rather than a large sample of clients.
- Market conditions continuously change; therefore, portfolio recommendations may vary depending on future economic developments.

- The study does not attempt to evaluate the long-term performance of the recommended investment portfolio.
- The findings are primarily applicable to the organisational context observed during the internship and may not represent practices followed by every wealth management organisation.

Despite these limitations, the project provides meaningful practical insights into client profiling and portfolio design within a professional financial advisory environment.

4.11 Ethical Considerations

Ethical considerations are an important component of any research study, particularly when dealing with financial information and client-related activities. Throughout the internship and the preparation of this report, appropriate ethical standards were maintained to ensure the credibility and integrity of the study.

Confidentiality was given the highest priority during the project. No confidential client information, personal financial details, or sensitive organisational data has been disclosed in this report. The portfolio case study included in the project is based on information provided for academic learning purposes and has been presented without revealing any personally identifiable information.

The information included in the report has been prepared based on actual internship observations, organisational learning, and publicly available academic sources. Wherever published information has been used, proper acknowledgement has been provided through APA 7 referencing to avoid plagiarism and ensure academic honesty.

The study has been conducted solely for educational purposes as part of the PGDM curriculum. No information has been modified or misrepresented to influence the findings of the project. The observations, analysis, and recommendations presented in the report reflect the learning experience gained during the internship.

Professional conduct was maintained throughout the internship by following organisational policies, respecting workplace ethics, maintaining confidentiality, and performing assigned responsibilities sincerely. These ethical principles contributed to the authenticity and reliability of the project.

CHAPTER 5

ANALYSIS AND DISCUSSION

5.1 Introduction

This chapter presents the detailed analysis of the client profiling process and goal-based portfolio design observed during the Corporate Internship Programme at Prognosis Financial Private Limited. The analysis is based on practical exposure gained during the internship, portfolio planning activities, training sessions, client discussions, and a portfolio design case study assigned by the organisation.

The primary objective of this chapter is to understand how financial advisors analyse client information before recommending suitable investment strategies. Every investment recommendation depends on a comprehensive understanding of the client's financial profile, investment objectives, risk tolerance, liquidity requirements, and investment horizon. Therefore, client profiling forms the foundation of effective financial planning.

The chapter also analyses the challenges associated with manual client profiling, evaluates different portfolio construction approaches, discusses the rationale behind the recommended portfolio, and presents an implementation plan based on practical wealth management principles.

5.2 Existing Client Profiling Process

Client profiling is the first and one of the most important stages of the wealth management process. Before recommending any financial product, advisors must understand the client's financial situation, future objectives, investment experience, and willingness to accept financial risk.

During the internship at Prognosis Financial Private Limited, it was observed that the client profiling process follows a systematic approach consisting of several stages.

Initially, financial advisors conduct detailed discussions with clients to collect demographic and financial information. This includes age, occupation, monthly income, existing investments, liabilities, family responsibilities, tax status, and investment experience. These discussions help advisors develop an initial understanding of the client's financial background.

The next stage involves identifying the client's financial goals. Clients generally have different investment objectives such as retirement planning, children's education, wealth creation, purchasing a house, emergency fund creation, or tax saving. Advisors carefully prioritise these goals according to their expected time horizon and financial importance.

After identifying financial goals, advisors assess the client's investment horizon and liquidity requirements. Some clients require regular income, while others focus on long-term capital appreciation. Liquidity requirements also influence investment decisions because certain financial goals require funds within a shorter period.

Risk profiling forms another important stage of the process. Advisors evaluate the client's ability and willingness to bear investment risk by considering financial stability, investment experience, emotional response towards market fluctuations, and return expectations.

Finally, all collected information is analysed collectively before preparing a suitable investment portfolio. Asset allocation decisions are then made by balancing risk, expected return, diversification, and financial objectives.

The overall client profiling process observed during the internship is illustrated below.

Client Meeting

↓

Collection of Personal & Financial Information

Understanding Financial Goals

Risk Profiling

Investment Horizon Assessment

Liquidity Requirement Analysis

Portfolio Recommendation

This systematic approach ensures that investment recommendations remain personalised rather than product-oriented.

5.3 Problem Diagnosis

During the internship, several practical challenges were identified in the client profiling and portfolio recommendation process.

The first challenge observed was the significant amount of manual effort involved in collecting and analysing client information. Advisors recorded information through discussions, handwritten notes, questionnaires, and Excel sheets before preparing investment recommendations. This process required considerable time and depended heavily on individual interpretation.

Another challenge involved understanding multiple client objectives simultaneously. Most clients had more than one financial goal, such as retirement planning, children's education, wealth creation, and tax planning. Prioritising these objectives while maintaining an appropriate balance between liquidity and long-term investment required careful financial analysis.

The manual nature of client profiling also increased the possibility of inconsistency in analysis. Different advisors may interpret similar client information differently based on their experience and judgement. Although professional expertise plays an important role, the absence of a structured decision-support mechanism may affect consistency in portfolio recommendations.

Time management was another practical concern. Advisors often needed to analyse multiple client profiles within limited time while simultaneously addressing client queries, preparing documentation, and monitoring existing portfolios.

During training sessions and portfolio discussions, it was also observed that clients frequently had limited knowledge of investment products and financial markets. Financial advisors therefore devoted additional time to educating clients about diversification, risk management, mutual funds, investment horizons, and long-term wealth creation.

These observations highlighted the importance of systematic client profiling and reinforced the need for structured financial analysis before preparing investment recommendations.

5.4 Analysis of Client Requirements

One of the most important observations during the internship was that every client possesses unique financial characteristics. Therefore, portfolio recommendations cannot be standardised. Instead, they must be customised according to individual financial requirements.

The analysis of client requirements generally includes several important factors.

Financial Goals

Financial goals form the foundation of investment planning. Clients invest with different objectives such as retirement planning, children's higher education, purchasing property, wealth creation, emergency funds, or tax planning. Each goal requires different investment strategies and time horizons.

Income and Financial Capacity

Income determines the client's investment capacity and ability to tolerate financial risk. Clients with stable and higher incomes generally possess greater flexibility in selecting long-term growth-oriented investment options.

Investment Horizon

The investment horizon significantly influences portfolio construction. Long-term investors generally benefit from higher exposure to equity-oriented investments, whereas short-term investors may require relatively stable investment options.

Risk Appetite

Every client has a different psychological and financial ability to tolerate investment risk. Conservative investors generally prefer stable returns, while moderate and aggressive investors may accept higher volatility in exchange for greater long-term return potential.

Liquidity Requirements

Liquidity needs represent another important factor influencing investment decisions. Clients who require funds within a shorter period must maintain adequate investments in relatively liquid and stable financial instruments.

Family Responsibilities

Family responsibilities such as children's education, healthcare, dependent family members, and retirement planning significantly influence investment decisions. Advisors carefully consider these obligations while recommending suitable asset allocation strategies.

During the internship, it became evident that successful financial planning depends on balancing all these factors rather than focusing on expected investment returns alone.

The practical exposure reinforced that effective client profiling is not merely a data collection exercise but a comprehensive financial assessment that enables advisors to recommend personalised investment strategies aligned with individual financial goals.

5.5 Risk Assessment Process

Risk assessment is one of the most critical stages in financial planning because it helps determine the level of investment risk that is appropriate for a client. During the internship at Prognosis Financial Private Limited, it was observed that every investment recommendation was preceded by a detailed assessment of the client's financial capacity, investment objectives, and willingness to accept market fluctuations. The objective of the risk assessment process was to ensure that the proposed investment portfolio matched both the financial needs and the psychological comfort level of the client.

The organisation followed a systematic approach while assessing client risk. The assessment was not based on a single factor but considered a combination of financial and personal characteristics. These included the client's age, occupation, income stability, existing financial obligations, investment experience, future financial goals, investment horizon, and liquidity requirements.

During client discussions, advisors also attempted to understand the client's behaviour during market volatility. Clients who were comfortable with temporary declines in portfolio value were generally categorised as moderate or aggressive investors, whereas clients who preferred capital protection and stable returns were classified as conservative investors.

For the portfolio case assigned during the internship, the client possessed the following characteristics:

Particular	Client Details
Age	40 Years
Marital Status	Married
Dependents	Two Children (8 and 12 Years)
Investment Amount	₹50,00,000
Investment Objective	Long-Term Wealth Creation
Liquidity Requirement	Withdrawal of 20% after 2 years

Particular	Client Details
Risk Profile	Moderate Aggressive

Based on the above information, the client was classified as a **Moderate Aggressive Investor**. This classification was appropriate because the client had a long investment horizon, sought capital appreciation, and was willing to accept moderate market risk while also maintaining liquidity for future financial needs.

The risk assessment process demonstrated that investment recommendations should always be based on a comprehensive understanding of the client's financial profile rather than solely on expected investment returns.

5.6 Portfolio Design Methodology

Portfolio design refers to the process of selecting and allocating investments in a manner that balances risk and return while supporting the client's financial goals. During the internship, it was observed that portfolio construction involved careful analysis rather than simply selecting financial products with the highest expected returns.

The methodology adopted for portfolio design consisted of several systematic stages.

Step 1: Understanding Client Profile

The first stage involved analysing the client's demographic information, financial capacity, investment objectives, family responsibilities, and investment horizon. This information served as the foundation for the portfolio design process.

Step 2: Risk Classification

Based on the client's financial profile, an appropriate risk category was identified. The risk category determined the proportion of investments allocated towards growth-oriented and relatively stable investment options.

Step 3: Goal Prioritisation

Financial goals were prioritised according to their expected time horizon and importance. Short-term liquidity requirements were separated from long-term wealth creation objectives to ensure that investments remained aligned with the client's future financial needs.

Step 4: Asset Allocation

After understanding the client's goals and risk profile, investments were distributed across different asset classes. Diversification was maintained to reduce portfolio risk while improving long-term return potential.

Step 5: Selection of Investment Products

Suitable investment categories were identified based on the client's financial objectives. Diversified mutual funds, equity-oriented investments, and relatively stable investment options were selected according to the desired risk-return balance.

Step 6: Portfolio Review

The final stage involved evaluating whether the proposed portfolio adequately addressed the client's financial goals, liquidity requirements, diversification needs, and risk profile. Portfolio review also ensured that the investment strategy remained practical and consistent with financial planning principles.

This methodology ensured that portfolio recommendations were based on structured financial analysis rather than subjective judgement alone.

5.7 Case Study Analysis

A practical portfolio design case provided during the internship formed the basis of the project analysis. The case enabled the application of financial planning concepts to a realistic investment scenario and provided valuable insights into the portfolio construction process.

Client Profile

The client was a **40-year-old married individual** with two dependent children aged **8 years** and **12 years**. The client possessed an investment corpus of **₹50,00,000** available for investment as a lump sum amount.

The client intended to withdraw approximately **20% of the investment after two years** to meet anticipated financial requirements while investing the remaining amount for long-term wealth creation.

After evaluating the client's financial situation and investment objectives, the client was categorised as a **Moderate Aggressive Investor**.

Financial Objectives

The client's primary financial objectives included:

- Long-term wealth creation.
- Maintaining adequate liquidity for planned withdrawal after two years.
- Achieving capital appreciation through diversified investments.
- Managing investment risk without compromising long-term financial growth.
- Creating a balanced portfolio capable of supporting future family responsibilities.

Financial Analysis

The client's age suggested a sufficiently long investment horizon, allowing greater exposure to growth-oriented investments. At the same time, the planned withdrawal after two years required maintaining adequate liquidity within the portfolio.

Family responsibilities, particularly the future educational needs of two dependent children, further emphasised the importance of maintaining a balanced investment strategy. Excessively aggressive investments could expose the client to unnecessary volatility, whereas an overly conservative portfolio might fail to generate adequate long-term returns.

Consequently, a **Moderate Aggressive Portfolio** was considered the most appropriate investment strategy.

Portfolio Construction Principles Applied

The portfolio was designed using the following financial planning principles:

- Goal-Based Investing
- Portfolio Diversification
- Asset Allocation
- Risk-Return Balance
- Liquidity Management
- Long-Term Wealth Creation
- Periodic Portfolio Review

These principles ensured that the investment recommendations remained aligned with both the client's immediate financial needs and long-term financial objectives.

Expected Portfolio Outcome

The proposed portfolio was expected to:

- Generate long-term capital appreciation.
- Maintain adequate liquidity for planned withdrawal.
- Reduce investment risk through diversification.
- Balance growth-oriented investments with relatively stable assets.
- Support the client's future financial goals while maintaining an acceptable level of investment risk.

The portfolio case study clearly demonstrated the practical application of client profiling and goal-based portfolio design within a professional wealth management environment. It also reinforced the importance of personalised financial planning, where investment recommendations are tailored according to the client's unique financial circumstances rather than following a standardised investment approach.

5.8 Options Considered

Before finalising the portfolio recommendation, different investment options were analysed to identify the most suitable strategy for the client. Since the client had a **Moderate Aggressive Risk Profile**, a long-term investment objective, and a requirement to withdraw **20% of the investment after two years**, it was necessary to evaluate various portfolio alternatives before selecting the final allocation.

Three portfolio options were considered during the portfolio design process.

Option 1: Conservative Portfolio

A conservative portfolio would primarily consist of debt-oriented investment products, fixed-income securities, and low-risk investment instruments.

Advantages

- Lower investment risk.
- Stable and predictable returns.
- High capital protection.
- Suitable for short-term financial requirements.

Limitations

- Limited opportunity for long-term capital appreciation.
- Returns may not sufficiently beat inflation.
- Inadequate for achieving aggressive wealth creation goals.

Considering the client's long investment horizon and moderate aggressive risk profile, this option was not considered suitable.

Option 2: Aggressive Growth Portfolio

This portfolio would allocate a major proportion of investments towards equity-oriented assets with the objective of maximising long-term returns.

Advantages

- Higher wealth creation potential.
- Better long-term capital appreciation.
- Greater participation in equity market growth.

Limitations

- Higher market volatility.
- Greater investment risk.
- Increased possibility of short-term capital fluctuations.
- Not suitable considering the client's liquidity requirement after two years.

Although this option could generate higher returns over a longer period, it exposed the client to unnecessary market risk during the initial years of investment.

Option 3: Moderate Aggressive Diversified Portfolio (Selected)

The third option combined equity-oriented investments with relatively stable investment options. The objective was to balance long-term capital appreciation with adequate liquidity and risk management.

Advantages

- Balanced risk-return relationship.
- Adequate diversification.
- Supports long-term financial goals.
- Maintains liquidity for future withdrawal.
- Suitable for the client's financial profile.

After evaluating all alternatives, this option was selected because it best matched the client's financial objectives and risk tolerance.

5.9 Comparative Evaluation

The three portfolio alternatives were compared based on important financial planning criteria.

Criteria	Conservative Portfolio	Aggressive Portfolio	Moderate Aggressive Portfolio
Investment Risk	Low	High	Moderate
Expected Return	Moderate	High	Moderately High
Liquidity	High	Moderate	High
Wealth Creation	Limited	Excellent	Very Good
Market Volatility	Low	High	Moderate
Suitability for Client	Moderate	Moderate	Excellent

The comparative evaluation indicates that the Moderate Aggressive Portfolio provides the most balanced investment strategy. It offers sufficient growth potential while maintaining appropriate diversification and liquidity. Therefore, it was selected as the most suitable portfolio for the client.

5.10 Portfolio Allocation

Based on the detailed analysis of the client's financial profile, investment objectives, risk appetite, and liquidity requirements, the final portfolio was prepared.

The portfolio consisted of diversified mutual funds selected from different investment categories to maintain an appropriate balance between growth and stability. Equity-oriented mutual funds formed the major component of the portfolio because of the client's long investment horizon. At the same time, suitable allocation was maintained towards relatively stable investment options to support the planned withdrawal after two years.

The allocation was prepared according to the investment recommendations developed during the internship and reflected the principles of diversification, asset allocation, and goal-based investing.

The proposed portfolio emphasised:

- Diversification across multiple investment categories.
- Long-term wealth creation.
- Controlled investment risk.
- Liquidity management.
- Periodic portfolio review.

The detailed portfolio allocation prepared during the internship has been attached in **Appendix F** of this report.

5.11 Investment Strategy

The overall investment strategy adopted for the client focused on balancing long-term wealth creation with short-term liquidity requirements.

The strategy emphasised disciplined investing rather than attempting to maximise short-term returns. Investments were selected according to the client's financial goals instead of current market trends. Diversification was maintained across different categories of mutual funds to reduce portfolio risk while improving return potential.

The following principles guided the investment strategy:

Goal-Based Investing

Each investment recommendation was linked to the client's financial objectives rather than simply selecting high-return investment products.

Diversification

Investments were distributed across multiple categories to reduce concentration risk and improve portfolio stability.

Long-Term Wealth Creation

The majority of investments were directed towards long-term growth opportunities because the client possessed a sufficiently long investment horizon.

Liquidity Planning

Since the client intended to withdraw 20% of the investment after two years, adequate liquidity was incorporated into the portfolio design.

Periodic Portfolio Review

Regular monitoring and portfolio rebalancing were considered essential to maintain alignment with changing financial goals and market conditions.

This investment strategy ensured that the portfolio remained consistent with the client's financial objectives while balancing growth, liquidity, and investment risk.

5.12 Implementation Plan

The successful implementation of the proposed portfolio requires a systematic approach. The following implementation plan was developed during the project.

Stage	Activity	Expected Outcome
Stage 1	Complete client profiling and financial assessment	Comprehensive understanding of client requirements
Stage 2	Conduct risk profiling and identify investment objectives	Appropriate risk classification
Stage 3	Design diversified portfolio based on financial goals	Balanced asset allocation
Stage 4	Present portfolio recommendations and explain investment strategy	Client understanding and informed decision-making
Stage 5	Execute investment plan after client approval	Portfolio implementation
Stage 6	Periodic review and portfolio rebalancing	Continuous alignment with financial goals

The implementation process highlights that portfolio management is a continuous activity rather than a one-time investment decision. Regular review enables financial advisors to respond to changes in market conditions and client circumstances while maintaining the long-term effectiveness of the investment strategy.

5.13 Key Findings

The analysis carried out during the internship resulted in several important findings.

- Client profiling is the foundation of effective financial planning and portfolio construction.

- Every client requires a customised investment strategy based on financial goals, investment horizon, liquidity requirements, and risk tolerance.
- Goal-based investing enables more disciplined financial planning than return-oriented investing.
- Portfolio diversification significantly reduces investment risk while supporting long-term wealth creation.
- Asset allocation plays a more important role in portfolio performance than selecting individual investment products.
- Liquidity planning is essential when clients have specific future financial requirements.
- Professional judgement remains critical in wealth management despite increasing use of technology.
- A structured client profiling process improves consistency and quality in investment recommendations.

CHAPTER 6

FINDINGS AND RECOMMENDATIONS

6.1 Introduction

The analysis conducted during the internship provided valuable insights into the practical aspects of client profiling, financial planning, and portfolio management within the wealth management industry. The observations made during client interactions, training sessions, portfolio discussions, and the portfolio design case study helped in understanding how financial advisors evaluate client requirements before making investment recommendations.

This chapter presents the key findings of the study along with practical recommendations for improving client profiling, portfolio management, and financial advisory practices. The recommendations are based on internship observations, theoretical concepts, and the portfolio case analysed during the project.

6.2 Key Findings

The study generated several important findings regarding the client profiling process and goal-based portfolio design.

The first major finding is that **client profiling forms the foundation of every investment decision**. Before recommending any investment product, financial advisors must thoroughly understand the client's financial background, investment objectives, risk tolerance, and future financial requirements. A well-structured client profiling process significantly improves the quality of investment recommendations.

Another important finding is that **goal-based investing provides a more systematic approach to financial planning**. Instead of focusing only on expected investment returns, advisors

design portfolios according to specific financial objectives such as retirement planning, children's education, wealth creation, or emergency fund creation. This approach encourages disciplined investing and improves the likelihood of achieving long-term financial goals.

The study also found that **portfolio diversification plays a critical role in managing investment risk**. Diversifying investments across different asset classes and investment categories helps reduce portfolio volatility while maintaining opportunities for long-term capital appreciation.

Furthermore, the analysis highlighted the importance of **asset allocation** in determining portfolio performance. Appropriate allocation among equity, debt, and other investment options enables financial advisors to balance investment risk with expected returns while meeting client-specific financial objectives.

The internship also demonstrated that successful financial planning requires a combination of technical financial knowledge and effective communication skills. Financial advisors must educate clients about investment risks, market fluctuations, and long-term investment discipline to build confidence and strengthen client relationships.

6.3 Business Findings

The internship provided valuable insights into the functioning of the wealth management industry and the day-to-day activities of financial advisory services.

It was observed that the wealth management business is highly dependent on understanding client needs rather than simply selling financial products. Long-term client relationships are built through trust, transparency, ethical practices, and personalised financial advice.

Another important business finding is that client expectations have changed significantly in recent years. Investors increasingly seek customised financial solutions rather than standard investment products. As a result, financial advisors must develop personalised investment strategies that align with each client's financial circumstances and long-term objectives.

The study also revealed that technology is becoming increasingly important in financial advisory services. Digital financial planning tools, portfolio management software, and customer relationship management systems help advisors improve efficiency and organise client information more effectively. However, professional judgement remains essential because investment decisions often require interpretation beyond numerical analysis.

The internship further demonstrated that continuous client engagement is necessary for successful wealth management. Financial planning is not a one-time activity but an ongoing process that requires regular portfolio reviews, monitoring, and communication with clients.

6.4 Portfolio Findings

The portfolio case study provided several important insights into practical portfolio management.

The analysis confirmed that **goal-based portfolio design produces more balanced investment strategies** than return-oriented investing. By considering financial goals, investment horizon, and liquidity requirements simultaneously, advisors are able to design portfolios that better reflect client needs.

The study also highlighted the importance of balancing growth-oriented investments with relatively stable investment options. While equity investments support long-term wealth creation, maintaining sufficient liquidity is equally important for achieving short-term financial objectives.

The case study further demonstrated that diversification reduces portfolio concentration risk and improves overall portfolio stability. Investments distributed across multiple categories help minimise the impact of adverse market conditions on the overall portfolio.

Periodic portfolio review emerged as another important finding. Since client circumstances and market conditions continuously change, investment portfolios should be reviewed regularly to maintain alignment with financial objectives.

6.5 Risk Findings

Risk assessment was found to be one of the most important activities in the financial planning process.

The study revealed that every client possesses a different level of financial risk tolerance. Factors such as age, income stability, financial commitments, investment experience, and future financial goals significantly influence investment decisions.

Another important observation was that many investors focus primarily on expected returns while paying relatively less attention to investment risk. Financial advisors therefore play an important role in educating clients about the relationship between risk and return before recommending investment strategies.

The internship also highlighted that emotional factors frequently influence investment decisions. Fear during market declines and overconfidence during rising markets may lead investors to make irrational decisions. Effective financial advisory services therefore require understanding both financial and behavioural aspects of investing.

The portfolio case demonstrated that appropriate risk assessment enables advisors to recommend portfolios that are consistent with the client's financial capacity and psychological comfort level, thereby improving long-term investment success.

6.6 Recommendations

Based on the observations made during the internship and the analysis carried out in this study, the following recommendations are suggested.

Strengthen the Client Profiling Process

Financial advisors should continue to adopt a structured client profiling process that captures both financial and behavioural characteristics. A comprehensive understanding of the client's financial situation enables more accurate investment recommendations.

Promote Goal-Based Financial Planning

Investment recommendations should continue to focus on achieving specific financial goals rather than simply maximising short-term returns. Goal-based planning encourages disciplined investing and improves client satisfaction.

Enhance Portfolio Diversification

Diversification should remain an essential component of portfolio construction. Investment portfolios should include a balanced combination of different asset classes to minimise investment risk while maintaining growth potential.

Encourage Regular Portfolio Reviews

Financial advisors should conduct periodic portfolio reviews to ensure that investment allocations remain consistent with changing financial goals, market conditions, and client circumstances.

Improve Investor Education

Clients should be educated about investment risk, diversification, market volatility, and long-term investing. Better financial awareness enables investors to make informed decisions and avoid emotional reactions during market fluctuations.

Leverage Technology for Decision Support

Technology should be used to improve the efficiency of client profiling, portfolio analysis, and documentation. AI-assisted tools and digital platforms can support advisors by organising financial information while ensuring that final investment decisions remain under professional supervision.

6.7 Future Improvements

The present study provides several opportunities for future improvement.

Future studies may analyse a larger number of client cases to better understand variations in financial behaviour and investment preferences. Comparative studies involving different wealth management organisations may also provide broader insights into client advisory practices.

Additional research may evaluate the long-term performance of goal-based portfolios under different market conditions. Such studies could help identify investment strategies that consistently achieve financial objectives while maintaining acceptable levels of investment risk.

The increasing adoption of Artificial Intelligence and data analytics within financial services also presents opportunities for future research. AI-assisted client profiling and portfolio

recommendation systems may improve operational efficiency, provided they continue to support rather than replace professional financial judgement.

Finally, integrating real-time market information, predictive analytics, and automated portfolio monitoring may further enhance the effectiveness of financial planning and wealth management services in the future.

CHAPTER 7

LEARNING OUTCOMES

7.1 Introduction

The Corporate Internship Programme provided an opportunity to bridge the gap between classroom learning and practical industry exposure. Throughout the internship at Prognosis Financial Private Limited, I was able to apply concepts learned during the PGDM programme to real-world financial advisory and wealth management activities. The experience not only enhanced my technical knowledge of financial planning and portfolio management but also contributed to my professional, analytical, and interpersonal development.

The internship involved participating in training sessions, observing client interactions, understanding financial products, preparing investment portfolios, and analysing client requirements. These activities strengthened my understanding of the financial services industry and provided valuable insights into the responsibilities of wealth management professionals.

This chapter presents the major learning outcomes achieved during the internship and reflects on how the experience has contributed to my overall professional growth.

7.2 Technical Learning

One of the most significant outcomes of the internship was the development of technical knowledge related to wealth management and investment advisory. The practical exposure helped me understand how theoretical concepts are applied while working with real clients and financial products.

During the internship, I developed a clear understanding of the client profiling process, which forms the basis of investment planning. I learned how financial advisors collect and analyse client information before recommending suitable investment strategies. This included understanding demographic details, financial goals, investment horizon, liquidity requirements, and risk appetite.

The internship also enhanced my knowledge of portfolio construction. I learned how diversified portfolios are prepared by applying concepts such as asset allocation, portfolio diversification, and risk-return balancing. Observing practical portfolio discussions enabled me

to appreciate the importance of aligning investment recommendations with individual financial objectives rather than focusing solely on expected returns.

Exposure to financial planning tools, investment products, and portfolio management practices also strengthened my understanding of mutual funds, insurance products, retirement planning, and long-term wealth creation strategies. These technical skills have significantly improved my confidence in applying financial management concepts to practical situations.

7.3 Financial Learning

The internship substantially improved my understanding of financial planning and wealth management. Classroom concepts such as Modern Portfolio Theory, diversification, asset allocation, risk profiling, and goal-based investing became much clearer after observing their practical application in the organisation.

One of the most valuable financial lessons was understanding the importance of personalised investment planning. I learned that investment recommendations cannot be standardised because every client has unique financial goals, responsibilities, and risk tolerance. Effective financial planning therefore requires detailed analysis before selecting appropriate investment products.

The portfolio case study assigned during the internship further enhanced my financial decision-making skills. Analysing the client's financial objectives and designing a suitable portfolio helped me understand how financial theories are translated into practical investment recommendations.

Another important learning outcome was recognising the relationship between risk and return. The internship demonstrated that successful investment planning involves balancing expected returns with the client's financial capacity and willingness to accept investment risk.

Overall, the internship strengthened my financial analytical abilities and improved my understanding of practical wealth management practices.

7.4 Professional Learning

The internship provided valuable exposure to the professional work environment and organisational culture. Working within a financial services organisation helped me understand workplace discipline, professional ethics, time management, and the importance of responsibility in client-facing roles.

I learned the importance of maintaining accuracy while handling financial information and preparing portfolio recommendations. Even minor errors in financial analysis can affect investment decisions, making attention to detail an essential professional skill.

The internship also demonstrated the value of teamwork and continuous learning. Regular interactions with financial advisors and participation in training sessions encouraged me to expand my knowledge of financial markets, investment products, and wealth management practices.

Another important professional lesson was understanding the importance of ethical conduct and confidentiality. Since financial advisory services involve sensitive client information, maintaining privacy and professional integrity is essential in building long-term client trust.

The internship has therefore contributed significantly to my professional maturity and prepared me for future responsibilities within the financial services industry.

7.5 Communication Skills

The internship provided several opportunities to improve my communication skills. Effective communication plays a crucial role in financial advisory because investment decisions require clear explanation of financial concepts, investment risks, and portfolio recommendations.

During training sessions and team discussions, I learned how financial advisors explain complex financial products in a simple and understandable manner. I also observed the importance of listening carefully to clients in order to understand their financial expectations and concerns.

Preparing financial documents, maintaining professional communication within the organisation, and participating in discussions improved both my verbal and written communication skills. I also gained confidence in presenting financial information in a structured and professional manner.

The internship reinforced the understanding that strong communication skills are essential not only for client interaction but also for collaboration within the organisation.

7.6 Client Interaction

One of the most valuable aspects of the internship was observing how financial advisors interact with clients. Although confidentiality restrictions limited direct involvement in detailed client discussions, observing the advisory process provided significant practical learning.

I learned that successful client interaction requires patience, professionalism, and a thorough understanding of client requirements. Financial advisors spend considerable time understanding clients' financial goals, investment experience, family responsibilities, and future expectations before making any investment recommendations.

The internship also highlighted the importance of building trust during client interactions. Clients are more likely to accept financial advice when advisors demonstrate transparency, professionalism, and genuine concern for their financial well-being.

These observations helped me appreciate that financial advisory extends beyond technical knowledge and requires strong interpersonal skills to develop long-term client relationships.

7.7 Employability

The Corporate Internship Programme has significantly improved my employability by enhancing both my technical competencies and professional skills.

The practical exposure gained during the internship strengthened my understanding of wealth management, financial planning, client profiling, portfolio management, and investment advisory services. These experiences have increased my confidence in applying academic knowledge within professional environments.

The internship also improved several transferable skills, including analytical thinking, problem-solving, time management, communication, teamwork, and adaptability. These competencies are valuable across different roles within the financial services industry.

Furthermore, the experience provided practical exposure to organisational processes, client-oriented services, and professional workplace behaviour. It has prepared me to contribute effectively to organisations operating in banking, financial advisory, investment management, wealth management, and other finance-related sectors.

The internship has therefore played an important role in enhancing my career readiness and strengthening my professional capabilities.

7.8 Reflection

The Corporate Internship Programme has been a valuable learning experience that enabled me to apply classroom knowledge in a professional environment. It provided practical exposure to financial planning, client profiling, investment analysis, and portfolio design while helping me understand the responsibilities associated with wealth management services.

One of the most important lessons I learned is that successful financial planning requires much more than technical knowledge. Understanding client needs, maintaining ethical standards, communicating effectively, and exercising professional judgement are equally important in providing quality financial advisory services.

The internship also helped me identify areas where I can continue improving, particularly by expanding my knowledge of financial markets, investment analysis, and emerging technologies used in financial services. Continuous learning will remain essential as the financial industry continues to evolve.

Overall, the internship has strengthened my confidence, enhanced my professional outlook, and provided valuable practical experience that will support my future career in the finance industry. The knowledge and skills gained during this internship will continue to guide my professional development and contribute to my long-term career goals.

CONCLUSION

The Corporate Internship Programme at **Prognosis Financial Private Limited** provided an excellent opportunity to gain practical exposure to the wealth management and financial advisory industry. The internship successfully bridged the gap between theoretical concepts learned during the PGDM programme and their practical application in a professional work environment. It enhanced my understanding of client profiling, financial planning, portfolio construction, investment analysis, and wealth management practices.

The project titled "**Client Risk Profiling and Goal-Based Portfolio Design**" focused on understanding the importance of analysing client requirements before recommending suitable investment strategies. The study demonstrated that effective client profiling forms the foundation of successful financial planning. By carefully assessing a client's financial goals, investment horizon, liquidity requirements, and risk tolerance, financial advisors are able to develop personalised investment portfolios that are better aligned with individual financial objectives.

The portfolio case study undertaken during the internship highlighted the practical application of financial concepts such as diversification, asset allocation, risk management, and goal-based investing. The analysis confirmed that no single investment strategy is suitable for every client. Instead, investment decisions should always be based on a comprehensive understanding of the client's financial circumstances and long-term objectives. A diversified portfolio combined with disciplined financial planning provides a balanced approach to managing investment risk while supporting sustainable wealth creation.

The internship also provided valuable insights into the challenges faced by financial advisors during client profiling and portfolio planning. It was observed that the process requires significant manual effort, careful interpretation of financial information, and continuous interaction with clients. As part of the Individual Contribution (IC) component, the project explored the potential of AI-assisted decision support in improving the efficiency of client profiling and portfolio analysis. While the AI component remained separate from this report, the experience highlighted the growing importance of technology in supporting financial advisory services without replacing professional judgement.

From a personal and professional perspective, the internship significantly enhanced my technical knowledge, analytical ability, communication skills, and understanding of organisational practices. It improved my confidence in applying financial concepts to practical situations and strengthened my understanding of wealth management, investment planning, and portfolio management. The experience also reinforced the importance of ethical conduct, client confidentiality, continuous learning, and professional responsibility within the financial services industry.

Overall, the Corporate Internship Programme has been a valuable learning experience that contributed significantly to my academic development and career readiness. The knowledge, skills, and practical exposure gained during the internship have strengthened my interest in the finance domain and will serve as a strong foundation for my future professional career.

FINAL AI CASE WRITE-UP AND PROOF BUNDLE

Project Title

Client Risk Profiling and Goal-Based Portfolio Design

1. Introduction

This document presents the final AI case write-up prepared during the Corporate Internship Programme at Prognosis Financial Private Limited. The project focuses on proposing an AI-assisted decision support framework to improve the client profiling and portfolio recommendation process within wealth management.

During the internship, it was observed that financial advisors manually collect and analyse client information before preparing suitable investment recommendations. This process requires considerable time and depends on individual judgement. To address this challenge, a conceptual AI-assisted framework has been proposed that supports financial advisors by organising client information, assisting in risk assessment, and generating preliminary portfolio recommendations. The proposed solution is intended to support decision-making while ensuring that the final investment recommendation remains under professional supervision.

2. Problem Identified

The existing client profiling process requires advisors to manually collect demographic information, financial details, investment objectives, liquidity requirements, and risk preferences before recommending suitable investment products.

The manual nature of this process increases the time required for client analysis and may result in inconsistencies when evaluating multiple client profiles. As every client has different financial goals and investment preferences, preparing personalised portfolio recommendations becomes a detailed and resource-intensive task. These observations led to the proposal of an AI-assisted decision-support framework that could improve efficiency while maintaining professional judgement.

3. Proposed AI Solution

The proposed solution is an **AI-Assisted Client Risk Profiling and Goal-Based Portfolio Recommendation Framework**.

The framework accepts key client information such as:

- Age
- Occupation
- Annual Income
- Family Details

- Investment Amount
- Investment Objectives
- Investment Horizon
- Liquidity Requirements
- Risk Preference

Based on these inputs, the proposed framework assists in:

- Organising client information systematically
- Identifying financial goals
- Supporting risk categorisation
- Suggesting preliminary asset allocation
- Generating structured portfolio recommendations

The proposed AI framework is designed to function as a decision-support system. The final investment recommendation continues to be reviewed and approved by a qualified financial advisor.

4. Proposed Workflow

Client Information Collection

Financial Goal Identification

Risk Assessment

AI-Assisted Analysis

Preliminary Portfolio Recommendation

Financial Advisor Review

↓
Final Portfolio Recommendation

5. Demonstration

The proposed AI framework was demonstrated using the portfolio case assigned during the internship.

Sample Client

- Age: 40 Years
- Married
- Two Children (8 Years and 12 Years)
- Investment Amount: ₹50,00,000
- Planned Withdrawal: 20% after Two Years
- Investment Horizon: Long-Term
- Risk Profile: Moderate Aggressive

Using the above information, the proposed framework demonstrates how client data can be organised, risk can be categorised, and a preliminary portfolio recommendation can be generated before being reviewed by a financial advisor.

The demonstration represents the proposed working of the framework and illustrates its potential application in supporting client profiling and portfolio planning.

6. Outcome

The proposed AI-assisted framework demonstrates how technology can support financial advisors by reducing manual effort involved in client profiling and portfolio planning. It helps organise client information, improves consistency in financial analysis, and supports structured preliminary recommendations.

Although the framework was not implemented within the organisation during the internship, the demonstration indicates that it has the potential to improve operational efficiency and support better decision-making if developed and integrated in the future.

7. Proof Items Submitted

S. No.	Proof Item	Description
1	AI Solution Design Framework	Document explaining the proposed AI-assisted solution for client profiling and portfolio recommendation.

S. No.	Proof Item	Description
2	AI Workflow	Flowchart illustrating the proposed workflow from client profiling to portfolio recommendation.
3	Client Portfolio Case Demonstration	Demonstration of the proposed framework using the internship client case study.
4	Completed AI Case Template	AI Case Template completed across all required sections (Sections 1–5).
5	Supporting Documentation	Project proposal, AI solution framework, workflow documentation, and related project artefacts prepared during the internship.

8. Consistency Check

The proposed AI solution has been reviewed to ensure consistency across all submissions completed during the Corporate Internship Programme.

Component	Status
Problem Statement	✓ Consistent
Proposed AI Solution	✓ Consistent
Solution Design	✓ Consistent
Demonstration	✓ Level 1 Demonstration
Organizational Response	✓ Included
Supporting Documentation	✓ Attached

The project consistently presents the AI framework as a **proposed decision-support solution** intended to assist financial advisors rather than replace professional judgement.

9. Limitations

The proposed AI framework was developed as a conceptual solution during the internship. Due to the limited internship duration, organisational confidentiality, restricted access to company systems, and the scope of the Corporate Internship Programme, a fully functional AI application was not developed or deployed.

The demonstration presented in this project is based on a representative client case and is intended to illustrate how the proposed framework could support client profiling and portfolio

recommendation. Future implementation would require organisational approval, technical development, access to historical client data, testing, validation, and integration with existing systems.

10. Future Scope

The proposed framework can be further enhanced by integrating it with client relationship management (CRM) systems and portfolio management software used by financial advisory organisations. Future improvements may include automated client profiling, predictive investment analytics, real-time market data integration, portfolio optimisation, and AI-assisted report generation.

Such developments could improve the efficiency of financial advisory services while ensuring that final investment decisions continue to be made by qualified financial professionals.

11. Conclusion

The proposed AI-Assisted Client Risk Profiling and Goal-Based Portfolio Recommendation Framework demonstrates how Artificial Intelligence can support wealth management by improving the efficiency and consistency of client profiling and preliminary portfolio planning. The framework has been designed as a decision-support system that assists financial advisors in organising client information, assessing risk, and generating structured portfolio recommendations.

Although the framework remains at the conceptual stage, it successfully addresses the business problem identified during the internship and demonstrates a practical approach to integrating AI into financial advisory services. The project also highlights that technology should complement professional expertise rather than replace it. Overall, the proposed solution provides a strong foundation for future implementation and aligns with the objectives of the Corporate Internship Programme.

Client is 40 year old married having two kids 8 year and 12 year old
 50 Lakhs Lump Sum
 He want to withdrawal 20% After 2 year and rest for long Term Investment
 Risk Moderate Aggressive This is the hypothetical situation. If I want to design the portfolio, which kind of funds and shcemes I should include.

Alright — this is now becoming actual **financial advisory style portfolio construction**.
 I'll explain this exactly like a wealth management advisor would think.

Client Profile Understanding

Factor	Meaning	
Age 40	Medium-long investment horizon	
Married + 2 kids	Need stability + growth	
Kids age 8 & 12	↓ Education goals approaching in 6–10 years	

FINAL READY PORTFOLIO

Category	Suggested Scheme Type	Amount
Corporate Bond Fund	ICICI/HDFC Corporate Bond	₹6 lakh
Arbitrage Fund	Kotak/Nippon Arbitrage	₹4 lakh
Index/Large Cap	UTI Nifty Index	₹9 lakh
Flexi Cap	Parag Parikh Flexi Cap	₹9 lakh
Mid Cap	Motilal Oswal Midcap	₹7.5 lakh
Small Cap	Nippon Small Cap	₹3 lakh
International	Nasdaq 100 FoF	₹1.5 lakh
Gold ETF	Nippon/HDFC Gold ETF	₹5 lakh
